

CIMT Further Statistics p53 Ex3E - Solved using Wilcoxon Single Sample test, and not the Sign Test.

1. we have single sample data

we shall assume distribution of annual salaries is symmetrical - this dotplot supports that assumption.

hence do Wilcoxon Signed Rank test

| Salaries | median | salaries - median | salaries - median | rank |
|----------|--------|----------------------|----------------------|----------|
| 13250 | 12000 | 1250 | 1250 | 3 |
| 7485 | 12000 | -4515 | 4515 | <u>8</u> |
| 15136 | 12000 | 3136 | 3136 | 6 |
| 12258 | 12000 | 258 | 258 | 1 |
| 11019 | 12000 | -981 | 981 | <u>2</u> |
| 14268 | 12000 | 2268 | 2268 | 4 |
| 19536 | 12000 | 7536 | 7536 | 10 |
| 14326 | 12000 | 2326 | 2326 | 5 |
| 16326 | 12000 | 4326 | 4326 | 7 |
| 17984 | 12000 | 5984 | 5984 | 9 |

H_0 : salaries have median of £12000

H_1 : median salaries > £12000

Assume H_0 to be true

$\alpha = 10\%$,

one-tail test

$$W_- = 2 + 8 = 10$$

$$W_+ = 3 + 6 + 1 + 4 + 10 + 5 + 7 + 9 = 45$$

$$\text{let } W = \min(W_-, W_+) = 10.$$

we want $P(W \leq 10)$ when $n=10$.

$$\text{from tables, } P(W \leq 13) = 0.10$$

$$P(W \leq 10) = 0.05$$

$$P(W \leq 8) = 0.25$$

$$\therefore P(W \leq 10) \approx 0.05 < 0.10.$$

So, we are inside 10% critical region

We therefore reject H_0 and conclude that there is evidence that median annual salaries exceed £12000.

2. A - highest grade
B
C
D
E
F - lowest grade

H_0 : median grade is C

H_1 : median grade is not C

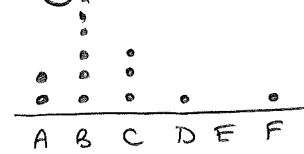

we have single sample data

we assume distribution of grades is symmetrical

(this is doubtful !!)

assume H_0 to be true

$\alpha = 5\%$, two tail test

| grade | median | grade - median | grade - median | rank |
|-------|--------|-------------------|-------------------|---|
| C | C | 0 | | |
| B | C | 1 | 1 | 1 \rightarrow 4 |
| A | C | 2 | 2 | 8 \rightarrow 8.5 |
| B | C | 1 | 1 | 2 \rightarrow 4 |
| B | C | 1 | 1 | 3 \rightarrow 4 |
| C | C | 0 | | |
| D | C | -1 | 1 | 4 \rightarrow 4 |
| C | C | 0 | | |
| F | C | -3 | 3 | 10 \rightarrow 10 |
| B | C | 1 | 1 | 5 \rightarrow 4 |
| A | C | 2 | 2 | 9 \rightarrow 8.5 |
| B | C | 1 | 1 | 6 \rightarrow 4 |
| B | C | 1 | 1 | 7 \rightarrow 4 |

$$\text{so } W_- = 4 + 10 = 14$$

$$W_+ = 4 + 8.5 + \dots + 4 + 4 = 41$$

$$\text{so } W = \min(W_-, W_+) \\ = 14$$

we want $P(W \leq 14)$ for $n=10$

from tables $P(W \leq 13) = 0.10$

$$P(W \leq 10) = 0.05$$

$$P(W \leq 8) = 0.25$$

$$\text{now } P(W \leq 14) > P(W \leq 13) = 0.10$$

so we are not in most extreme 2.5% of distribution (2 tail, 5% test)

Hence we do not reject H_0

We conclude that we don't have evidence to suggest that the median grade is not a C.

3. H_0 : median speed = 30 mph

H_1 : median speed > 30 mph.

Assume H_0 to be true

Assume parent distribution of speeds is symmetrical:

from the stem and leaf plot, this looks doubtful

```

2 | 4 9 9
3 | 5 0 2 5 4 0 8 8 0 4 9 8 0
4 | 2 2 1 3 0
5 | 6
6 | 2
7 | 2

```

$\alpha = 5\%$

one-tail test

5/6 = 56 mph

| speed | median | speed - median | speed - median | rank |
|-------|--------|-------------------|-------------------|-----------|
| 24 | 30 | -6 | 6 | 8 |
| 29 | 30 | -1 | 1 | 1 → 1.5 |
| 29 | 30 | -1 | 1 | 2 → 1.5 |
| 30 | 30 | 0 | | |
| 30 | 30 | 0 | | |
| 30 | 30 | 0 | | |
| 30 | 30 | 0 | | |
| 32 | 30 | 2 | 2 | 3 |
| 34 | 30 | 4 | 4 | 4 → 4.5 |
| 34 | 30 | 4 | 4 | 5 → 4.5 |
| 35 | 30 | 5 | 5 | 6 → 6.5 |
| 35 | 30 | 5 | 5 | 7 → 6.5 |
| 38 | 30 | 8 | 8 | 9 → 10 |
| 38 | 30 | 8 | 8 | 10 → 10 |
| 38 | 30 | 8 | 8 | 11 → 10 |
| 39 | 30 | 9 | 9 | 12 |
| 40 | 30 | 10 | 10 | 13 |
| 41 | 30 | 11 | 11 | 14 |
| 42 | 30 | 12 | 12 | 15 → 15.5 |
| 42 | 30 | 12 | 12 | 16 → 15.5 |
| 43 | 30 | 13 | 13 | 17 |
| 56 | 30 | 26 | 26 | 18 |
| 62 | 30 | 32 | 32 | 19 |
| 72 | 30 | 42 | 42 | 20 |

$$\text{so } W_- = 8 + 1.5 + 1.5 = 11$$

$$W_+ = 3 + 4.5 + \dots + 19 + 20 = 199$$

$$\text{so } W = \min(W_-, W_+) = 11$$

we want $P(W \leq 11)$ for $n = 20$

from tables $P(W \leq 70) = 0.10$

$n = 20$ $P(W \leq 60) = 0.05$

$P(W \leq 52) = 0.25$

so $P(W \leq 11) < 0.05$ and so we are in critical region

we have evidence to reject H_0 and conclude that median speeds exceed 30 mph.

4.

| | | | | | | | |
|-------------|----|----|----|----|----|---|----------|
| adjustments | 0 | 1 | 2 | 3 | 4 | 5 | ≥ 6 |
| no. days | 61 | 54 | 65 | 18 | 12 | 9 | 31 |
| median | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

$$\sum \text{days} = 250$$

| | | | | | | | |
|----------------------|----|---|---|---|---|---|----|
| adjustments - median | -1 | 0 | 1 | 2 | 3 | 4 | 5+ |
|----------------------|----|---|---|---|---|---|----|

| | | | | | | | |
|----------------------|---|--|---|---|---|---|----|
| adjustments - median | 1 | | 1 | 2 | 3 | 4 | 5+ |
|----------------------|---|--|---|---|---|---|----|

| | | | | | | | |
|------|---------------------------------------|----------------------|--------------|--------------|--------------|--------------|--|
| Rank | 1 \rightarrow 61 | 62 \rightarrow 126 | 127 | 145 | 157 | 166 | |
| | | | \downarrow | \downarrow | \downarrow | \downarrow | |
| | | | 144 | 156 | 165 | 196 | |
| | sum of 126 ranks | | | | | | |
| | $= \frac{1}{2} \times 126 \times 127$ | | | | | | |
| | $= 8001$ | | | | | | |
| | split equally gives | | | | | | |
| | 63.5 | | | | | | |

H_0 : median adjustments = 1

H_1 : median adjustments $\neq 1$

Assume H_0 to be true

$\alpha = 5\%$

two tail test

Also assume distribution of adjustments is symmetrical (this is doubtful)

$$\text{so } W_- = 61 \times 63.5 = 3873.5$$

$$W_+ = 65 \times 63.5 + 127 + \dots + 196$$

$$= 4127.5 + 1130.5 \quad \leftarrow \frac{1}{2} \times 196 \times 197 - \frac{1}{2} \times 126 \times 127$$

$$= 15432.5$$

$$\text{so } W = \min(W_-, W_+)$$

$$W = 3873.5$$

$$\text{we want } P(W \leq 3873.5) \text{ for } n = 250 - 54 = 196$$

we need to do Normal approximation

$$E(W) = \frac{1}{4} \times 196 \times 197 = 9653$$

$$\text{Var}(W) = \frac{1}{24} \times 196 \times 197 \times (2 \times 196 + 1) = 632271.5$$

$$\text{so } P(W \leq 3873.5) \approx P\left(Z < \frac{3873.5 - 9653}{\sqrt{632271.5}}\right)$$

$$= P(Z < -7.26839)$$

$$\approx 0$$

so at 5% level, we reject H_0

Hence we conclude that we have evidence that the median number of adjustments is not 1.

A test for the true mean daily number of adjustments would be difficult as it would require us to assume that the " ≥ 6 " category were all, say, 6's, when in fact the larger number of adjustments would affect the mean in a way that they do not affect the median.
